

Freely-accessible salt blocks is a simple, practical and reliable solution

Salt supplements are critical as fodder is naturally low in sodium.

Salt is the only element (along with water) that livestock have a specific appetite for, i.e. they can tailor their intake to match their needs, so there is no waste (no over or under-eating) or loss as the salt comes in compressed, compact form.

As livestock need salt all the time, enough **SODI SEL'PUR** licks must be freely accessible for them to use all year round, either in the barn or in pasture.

- **5kg** ▶ 210-block **pallet** (1050 kg net)
- **12kg** ▶ 96-block **pallet** (1152 kg net)
- **25kg** ▶ 45-block **pallet** (1125 kg net)

Composition : Sodium chloride: : **100 %**
i.e. **39,3 %** sodium.

Directions for use :

Make freely and continuously available. Put out one type of block at a time.

	Number of animals per block
Cattle / Horses  / 	5 to 10
Sheep / Goats  / 	20

Maximise intake by ensuring livestock can drink regularly.

Renew supply according to intake: approximately 40 g per day per head of cattle and 5 g per day per sheep or goat. This can be temporarily raised for livestock unused to licks or suffering from salt /mineral deficiencies.
